The Model 5915-X Low-Pass Risetime Filters are designed for OEM use in high speed digital networks and telecom systems. Filters are available for all SONET, SDH, Fiber Channel, and Gigabit Ethernet data rates. In addition, PSPL can build custom-frequency filters for any frequency from 35 MHz to 10 GHz. The -3 dB bandwidth of the standard filters is $0.75 \times \text{Bit Rate}$. These filters are a PSPL proprietary, absorption filter design that has attenuation and group delay frequency responses similar to those of the **Bessel-Thomson** filter. Bessel-Thomson filters filter by reflection and thus can cause increased bit error rates and eye diagram closure due to multiple reflections. By contrast, the PSPL filters filter by absorption. They have excellent impedance matches and very good return losses, both within and above the filter pass band. For additional details on these filters, see PSPL application note, AN-7a, "Low-Pass Risetime Filters for Time Domain Applications." When ordering, specify the desired -3 dB bandwidth frequency or 10%-90% risetime. The 5915-X is the suggested replacement for PSPL's discontinued design 5905 and 5910 filters.
